

## HOW LMK WORKS

The Loose Media Kiosk is designed to let you quickly preview the contents of evidentiary digital storage devices. The kiosk will divide the contents of the drive into categories which can be sorted by file name, type, or size, and you can select files to open them with a variety of programs. The kiosk can preview files using Nero Showtime, Apple QuickTime, Adobe Reader, Internet Explorer, Windows Media Player, and other applications.

Once you find files of interest you can mark them for output. When you are finished previewing files you can output everything you've marked to a DVD that will contain all the output files in an uncompressed zip file along with a report containing the hash value of each file. To prevent virus infection, the kiosk will reboot and return to a clean state after you have completed output or logged out. You can then log back in if you have additional storage devices to examine.

The LMK is not set up to preview deleted files or perform an in-depth analysis of data such as residue extraction. If an in-depth analysis of the evidentiary digital media is required then it should be submitted to a CART or RCFL location.

## LOCATIONS

The kiosks will be physically located in select FBI Field Offices and RCFLs by September 30, 2010.

## LOOSE MEDIA KIOSKS

GETTING INVESTIGATORS THE  
RESULTS THEY NEED-NOW

## INTRODUCING THE LOOSE MEDIA KIOSK (LMK)

The FBI's latest preview tool lets investigators safely—in a write protected environment—review evidentiary data found on devices such as Universal Serial Bus (USB) media, FireWire media, CDs, DVDs, flash memory cards, and floppy disks.

**Locations**—The kiosks are physically located in select FBI Field Offices and Regional Computer Forensics Laboratories (RCFLs).

**Using the LMK**—Kiosk users only need to have some familiarity with computers and are requested to watch a short training video. Assistance is also available on-site at LMK locations.

Shown here is a prototype LMK deployed to the FBI's Washington Field Office.

## THE LMK ENABLES USERS TO-

- **Safely Preview Data**—LMK customers can read files, watch video files, or listen to audio files.
- **Triage Data**—All logical files are categorized for easy preview.
- **Copy Data**—From loose media to a CD or DVD.
- **Generate a Report**—That contains the files that were output. Each report lists the MD5 hash of each file.
- **Copy the Report**—Onto a portable device, e.g., CD or DVD.

## FREQUENTLY ASKED QUESTIONS

**Q:** Is data found using the LMK presentable in court?

**A:** The LMK is a preview tool and enables investigators to see a portion of the data quickly and easily. The kiosk was not designed to take the place of a full-scale digital forensics examination performed by a certified Examiner; however, any evidence produced using the tool is admissible in a court of law.

**Q:** Typically, how long does it take to download the information from a piece of loose media using the kiosk? Is there a minimum? A maximum?

**A:** The LMK software performs an initial listing of all files and then categorizes the files by extension. Files are not downloaded to the LMK until they are selected for preview. Download times are dependent on the number and size of the files that are previewed.

**Q:** Can users preview more than one piece of loose media at a time?

**A:** No. The evidentiary loose media may contain a computer virus. In order to prevent the spread of the virus to other media, only one piece of media can be previewed at a time.

**Q:** Can non-FBI Personnel use the LMKs located in FBI Field Offices?

**A:** Yes, but on the condition that they have an FBI escort at all times. If that isn't possible, an RCFL is the most practical option for state/local law enforcement personnel to access the kiosks.

**Q:** Should you make an appointment to use the LMK?

**A:** Generally, it's best to call ahead at the LMK site to check their normal office hours.
